WORKING WITH STRINGS

POETRY OF PROGRAMMING – CLOJURE ASSIGNMENTS

Check: `filter`, `lower-case`, `count`, `starts-with?`, `fn`

(1) Write a function `short-words`, that from a collection of strings selects the ones shorter than 5.

```
(short-words ["hey" "hello" "" "raspberry"])
("hey" "")
```

(2) Write a function `a-words` that takes a collection of strings, and returns those strings that starts with letter a or A. The strings may have some leading space characters. For example,

```
(a-words [" hello " "apple" " ABC" "hey"])
("apple" " ABC")
```

HINT: write a predicate that checks whether a word starts with a or A when it's trimmed.
